LOW-LEVEL BURIAL GROUNDS DATABASE

1.0 INTRODUCTION

This report and accompanying microfiche of the Richland Solid Waste Information Management System database (RSWIMS database) were prepared to support the preparation of the revised Low-Level Burial Grounds Dangerous Waste Permit Application, DOE-RL 88-20 (DOE 1989). This report and the accompanying RSWIMS database summarize information and data on radioactive solid waste stored and disposed at the Hanford Site. All data for this report is summarized from the RSWIMS database. This is maintained by the Westinghouse Hanford Company.

The unfiled trenches may have received waste since the time of this listing; therefore, a more recent listing would show an increased amount of waste in the trenches. The purpose of this printout is to document the trench contents from January 1968 to December 1987 and to support the analysis and recommendations for the permit application. Reliable records are not available for the time before 1968.

The amount and detail of the data reported varies according to when the original records were prepared. Early data records provide less detail than more recent records. The amount of information available is proportional to the time frame in which it was required to report the information.

2.0 BACKGROUND

The RSWIMS database at the Hanford Site resides on the NAS6620 mainframe computer using hierarchical NOMAD 2 Database Management System software. The purpose of the RSWIMS database is to identify all radioactive solid waste that has been buried or stored in the 200 East Area and 200 West Area burial grounds from 1944 to the present.

The creation in 1970 of the transuranic (TRU) waste category designated 10 nCi/g as the lower limit for TRU radionuclide content; waste with TRU content greater than that limit was stored as TRU waste and waste less than that limit was buried in the Hanford Site burial grounds. In 1982, the limit was revised upward to the present value of 100 nCi/g. The equipment required to assay the 100 nCi/g limit was installed in the TRU Storage and Assay Facility in 1985. Thus a portion of the waste stored between 1970 and 1985 is now felt to be low-level waste and not TRU waste. This reclassification will be determined by assay of the waste.

The data are entered into the RSWIMS database via parent (shipment) and children (e.g., container and toxicity information) files. Relating information in two different children files requires that the programmer identify data in the parent file that can be used to patch the children file information together. This process requires programmers that are very

knowledgeable with the RSWIMS database and NOMAD 2. Improper patching of data will result in erroneous information.

The data are based on information entered on the Solid Waste Storage and Disposal Record which is used to input into the RSWIMS database. The information on the Solid Waste Storage and Disposal Records has changed over the years as requirements, regulations, and the increased need for more complete characterization has arisen.

Historically, several changes requiring additional information on TRU wastes have altered the scope of the RSWIMS database. In 1972, it was decided that the beta-gamma components of the waste should be decayed so that the input values and the decayed values could be calculated. This decay program assumed that all of the radionuclides were mixed fission products and that the radionuclide mix was monitored 1 year after discharge from the reactor.

From this information, radiation readings could be taken and converted into a total curie value. The computer could then divide the curie value into its various radionuclide components based on general source data and the facilities' operational mission. This method is no longer used. Since 1989, all waste generators are required to account for all radionuclides in the waste scheduled for storage and disposal at the Hanford Site.

Fuels irradiated for research studies were first received in the mid-1970's and are still being received at burial ground facilities. This material, small in volume and large in weight, is tracked in the category of TRU waste. The data on this waste are included in this report as part of the TRU waste inventory. The Integrated Database submittal includes this in the miscellaneous research reactor fuel category. This research reactor fuel will be retrieved with the stored TRU waste; however, treatment or storage of the spent fuel has not been addressed at this time.

In 1976, the Solid Waste Information Management System Program at the Idaho National Engineering Laboratory requested that more data be tracked and recorded on the Solid Waste Information Management System Program. The two main changes were for weight values and for waste categorization. The weight values were estimated for the purposes of record keeping; however, as more solid waste generators kept better track of their weights, the values were no longer estimated by the storage and disposal function. The waste categories were estimated until 1986 when the data were tracked on the RSWIMS database.

In 1980, data from group shipment records were placed in the RSWIMS database. In 1986, a data reentry program was undertaken for all waste disposed or placed in retrievable storage or buried areas. Data from each individual record were entered into the computer. During this reentry, information was taken from the Solid Waste Storage and Disposal Record to provide the current RSWIMS database. This data reentry program was completed in 1988 and covers the time frame from 1968, when records were first kept, to current waste receipts. Before this time frame, most of the information in the RSWIMS database was based on annual estimates.

In 1982, requirements to track individual TRU waste containers were enacted, replacing the per-shipment-accountability method. In 1985, the Solid Waste Burial Record-Transuranic was changed to the Solid Waste Storage Record-Transuranic. This change required more information on the hazardous material constituents and required defining the contents waste form. In 1988, the Solid Waste Storage Record was modified again to require additional information required by U.S. Department of Energy (DOE) Order 5820.2A (DOE-HQ 1988).

November 1984 marked the first time the NOMAD 2 system was used for record keeping. Existing TRU records are in the RSWIMS database, and therefore, the following information is available.

- Waste form (e.g., glass, concrete, plastic, cloth, rubber)
- Hazardous and corrosive constituents and quantity (post-1985 waste only)
- Radioactive material content (e.g., radionuclide identification and quantity, radiation level)
- Storage site location and date
- Generator or source of waste
- Container data (e.g., drums, steel or wood boxes, container size, volume, gross weight).

Segregation of TRU waste began in 1970. The segregation requirements have become more detailed over the years as DOE Orders changed. The sections of the DOE Orders regarding TRU waste are listed chronologically below.

1. March 20, 1970--Wastes with known or detectable contamination of transuranium radionuclides are to be packaged and buried in such a fashion that they can be readily retrievable as contamination-free packages within an interim period of 20 years; beyond that period retrievability should be possible (IAD NO. 0511-21).
2. September 19, 1973--Transuranium-contaminated solid wastes are those contaminated with certain alpha-emitting radionuclides (^{233}U , ^{238}Pu , ^{239}Pu , ^{241}Pu and ^{226}Ra) with long half-life periods and high specific radiotoxicities greater than or equal to 10 nCi/g. The packaging and storage conditions were to be such that the packages could be readily retrieved in an intact, contamination-free condition for 20 years. The packages were to be labeled so the waste they contain can be identified by cross-reference to permanent records. Combustible and noncombustible transuranium contaminated waste was to be packaged and stored separately (AEC Chapter 0511 "complete").
3. September 30, 1982--TRU contaminated materials, without regard to source or form, are those materials that at the end of institutional

control periods are contaminated with alpha-emitting radionuclides of atomic number greater than 92 and with a half-life greater than 20 year in concentrations greater than or equal to 100 nCi/g. This was part of TRU Waste Certification Compliance Requirement for Newly Generated Contact-Handled Waste for Shipment to Waste Isolation Pilot Plant (DOE Order 5820.1).

4. February 6, 1984--TRU waste, without regard to source or form, is radioactive waste that at the end of institutional control periods is contaminated with alpha-emitting TRU radionuclides with a half-life greater than 20 years and concentrations greater than or equal to 100 nCi/g. Regarding the Waste Isolation Pilot Plant, high-level waste and spent nuclear fuel as defined by this order are specifically excluded by this definition. On this date interim guides were provided for managing mixed waste (DOE Order 5820.2).
5. September 26, 1988--TRU Waste, without regard to source or form, is waste contaminated with alpha-emitting TRU radionuclides with a half-life greater than 20 years and concentrations greater than or equal to 100 nCi/g at the time of assay. Heads of Field Elements can determine that other alpha-contaminated wastes, peculiar to a specific site, must be managed as TRU waste. Test specimens of fissionable material irradiated for research and development purposes only and not for the production of power or plutonium may be classified as remote-handled TRU waste (DOE Order 5820.2A)

2.1 RSWIMS DATABASE LIMITATIONS

To understand the information in the NOMAD 2 database, the reviewer should be knowledgeable on the guidelines and assumptions used in entering the data or on the radionuclide decay data. They are listed below.

- Except for 105-N (N Reactor), all beta-gamma waste is assumed to be mixed fission products if specific radionuclides are not provided in the burial or storage record. This calculation is based on the fuel that is processed at the Plutonium-Uranium Extraction (PUREX) Facility. For 105-N, the mix is assumed to also contain mixed activation products. All estimations that are not directly given by the waste generator are calculated based on these ratios. The B Plant has processed ^{90}Sr and ^{137}Cs ; thus, these radionuclides are assumed to be the major constituents of the waste.
- The decay calculation portion of the NOMAD 2 program is only for the beta-gamma emitters, as described above, that are below lead in the periodic chart. Transuranics, and a few other radionuclides such as uranium and thorium, are not decayed because of their long half-life periods.
- The decay calculations are based on the dates on the burial or storage records.

- Weights for most of the TRU waste containers received before 1977 were estimated as part of the data upgrade. After this date, generators were required to provide this information regarding container weight. Weight calculations were established for pre-1977 waste at 28 lb/Hanford Site standard cardboard box, small boxes at 12 lb/cardboard box, lard cans at 50 lb, and TRU drums at 150 lb, or as specified on record; low-level waste drums and all other waste types were calculated at 28 lb/ft³.
- The data for low-level waste and the pre-1982 TRU waste are on a per-shipment basis. If the shipment contains more than one container, only total values (not individual container values) are available with the main exception to be the TRU inventories in each container. There is very limited container or shipment data available on waste generated before 1968. After TRU segregation began in May 1970 until 1982, data on the TRU content of most individual containers are based on a per-shipment basis. Consequently, if more than one container is present, only total values (not individual container values) are available. The contents are divided equally among all of the waste containers in the shipment, introducing an averaging effect on the data.
- Individual data for TRU waste containers, other than TRU content, were not implemented fully until 1984.
- Hazardous constituent data, when documented on the burial records, were entered into the RSWIMS database as part of the reentry program. However, it was not until 1986 that the hazardous constituents were required to be listed by the generator on the TRU storage records. Consequently, the information on hazardous constituents is very limited.
- Since 1986, the computer has tracked the certified TRU waste after it has been nondestructively examined in TRU storage and assay facility. Data obtained in this facility has been partially entered into the RSWIMS database.
- The RSWIMS database has the capability to track liquid organic waste; however, this capability has not been fully implemented. New codes must be installed to indicate the new types of waste constituents.
- Waste types (e.g., paper, cloth, equipment) are entered into the RSWIMS database. Before 1978, this type of data was limited because much of the waste was designated as miscellaneous process waste.
- Data from Nuclear Material Transaction Reports, DOE-Nuclear Regulatory Commission Form 741, were added to the RSWIMS database during entry of information. Some of the radionuclide values increased

significantly because this type of data was not accounted for previously in the RSWIMS database. Increases occurred in plutonium, enriched uranium, natural uranium, depleted uranium, and thorium.

- Contact-handled TRU Waste is packaged TRU with an external surface dose rate of less than or equal to 200 mrem/h.
- Remote-handled TRU waste is packaged TRU material whose external surface dose rate exceeds 200 mrem/h.

3.0 DESCRIPTION

The following material describes the organization, codes, and terminology used in the approximately 3,000 page printout of the RSWIMS database that constitutes the bulk of this report.

3.1 ORGANIZATION

The printout from the RSWIMS database is organized by low-level burial grounds waste facility area and then by trench within that area. Only the low-level burial grounds areas included in the permit application are included in this listing. Area 218-W-6 contained no waste when the listing was printed. Therefore, this listing identifies only seven of the eight low-level burial ground areas: 218-W-3A, 218-W-3AE, 218-W-4B, 218-W-4C, 218-W-5, 218-E-10, and 218-E-12B. Maps of the areas and trenches are contained in the permit application. The location of the waste is based on the Hanford Site coordinate system. The key to the container code is in the Appendix.

3.2 RSWIMS DATABASE CODES

The several waste types and their RSWIMS database codes are as follows:

TRU--Transuranic waste contains certain concentrations of transuranic radionuclides, as defined earlier, and is retrievably stored.

LLW--Low-level waste is waste that contains radioactivity and is not classified as high-level waste, TRU waste, spent nuclear fuel, or (11e(2) byproduct material as defined by DOE Order 5820.2A. Test specimens of fissionable material irradiated for research and development only and not for the production of power or plutonium may be classified as low-level waste, provided the concentration of TRUs is less than 100 nCi/g.

UC--Unsegregated Caisson waste was placed in the caissons in the 218-W-04B burial ground before 1970 and continued until they were full. The caissons are considered unsegregated because they have a mixture of unsegregated low-level and TRU waste or because calculations indicate that they contain greater than or equal to 100 nCi/g of TRU radionuclides.

UG--Unsegregated TRU waste was buried in the 218-W-04B burial ground before May 1970. Calculations indicate that buried waste material contains greater than or equal to 100 nCi/g of TRU radionuclides.

-UJ--Unsegregated TRU waste was buried in the 218-E-010 burial ground before May 1970. Calculations indicate that buried waste material contains greater than or equal to 100 nCi/g of TRU radionuclides.

UA--Unsegregated Non-TRU waste was buried in the burial grounds, 218-E-010, 218-E-12B and 218-W-03A, before May 1970. Calculations indicate that buried waste material contains less than 100 nCi/g of TRU radionuclides.

UB--Unsegregated Non-TRU waste was buried in the burial grounds, 218-E-010, 218-E-12B and 218-W-03A, before May 1970. Calculations indicate that buried waste material contains less than 100 nCi/g.

The Record Numbers refer to the original paper records that are kept on file at 2750-E in the 200 East Area by Solid Waste Engineering. Solid Waste Engineering keeps all the original or permanent records in fireproof safes until they are microfilmed. After microfilming, the original microfilm reels will be stored in the vault room in the Federal Building and Solid Waste Engineering will have working copies for review and support of data on the RSWIMS database.

The various codes used in the RSWIMS database to designate the beginning and ending coordinates for the trenches are defined as follows:

Beg Coor1	This column contains the north-beginning coordinate of a trench.
End Coor1	This column contains the north-ending coordinate of a trench.
Beg Coor2	This column contains the west-beginning coordinate of a trench.
End Coor2	This column contains the west-ending coordinate of a trench.
Waste Type	This column contains the waste type designating TRU, low-level waste, unsegregated caisson, unsegregated TRU waste buried in 218-W-04B and 218-E-010 burial grounds before May 1970, unsegregated non-TRU waste, and unsegregated non-TRU industrial waste, as defined in earlier in Section 3.2.
Record #	This column contains the generator building number, company, and record number in the RSWIMS database.

Cont Code This column contains the container codes. The container codes are defined in Table 1.

Amnt Cont This column contains the number of containers of a given type being stored or disposed.

Volume This column contains the volume of the containers of a given type in cubic feet.

Weight This column contains the weight of the waste and container in pounds.

Toxicity Code This column contains names of the hazardous constituent(s) in the waste as identified in one or more of the references. Toxicity codes references are listed below. Note: This data entry was not required before 1986; consequently, it will usually be blank for the preceding time period.

Toxic Qty This column contains the amount of potentially hazardous constituents in the waste, in pounds if known; otherwise, it will be blank. Note: This data was not required before 1986; consequently, it will usually be blank for the preceding time period.

3.3 TOXICITY CODE SOURCES

The identification of the hazardous substances used in the toxicity codes was obtained from the sources listed below:

1. Washington State Department of Ecology, Administrative Code-Chapter 173-303 "Dangerous Waste Regulations" Resource Conservation and Recovery Act, Code of Federal Regulations, Title 40, Parts 260 to 268
2. Toxic Substances Control Act, Code of Federal Regulations, Title 40, Parts 702 to 775
3. Occupational Safety and Health Act, Code of Federal Regulations, Title 29, Chapter XVII, Subpart Z, Parts 1910.1000 to 1910.1200
4. Department of Transportation, Code of Federal Regulations, Title 49, Parts 100 to 177
5. Microfiche--Edition Registry of Toxic Effects of Chemical Substances, Quarterly Issue. In accordance with Washington Administrative Code 173-303-084(2) and 084-101(2)(b) and National Institute for Occupational Safety and Health and Environmental Protection agencies, Code of Federal Regulations, Title 40, Table 302.4
